

In the Claims:

No amendments to the claims have been made. The following listing of claims is presented for the convenience of the Examiner:

1 1. (Original) A jitter measurement system comprising:
2 plural samplers for providing sample values, said plural samplers having
3 respective signal inputs and strobe inputs;
4 a pulse source for generating a pulse;
5 circuitry coupling a signal to said signal inputs and said pulse source to said
6 strobe inputs so that said samplers provide sample values corresponding to distinct transition
7 points in said signal; and
8 a data processor for determining jitter associated with said signal in part as a
9 function of said sample values.

1 2. (Original) The system of Claim 1, wherein said circuitry comprises at least
2 one delay element connected to at least one delayed one of said plural samplers, said delay
3 element being set to an amount less than the transition time of said signal, said samples being
4 used to determine the jitter associated with a single zero-crossing of said signal.

1 3. (Original) The system of Claim 2, wherein said sample produced by said
2 delayed sampler is used to determine the direction of zero-crossing of said signal, said sample
3 produced by a first one of said samplers being used to measure the time of said zero-crossing
4 of said signal, the measured time of said zero-crossing and the direction of said zero-crossing
5 being used by said data processor to calculate the jitter associated with said zero-crossing.

1 4. (Original) The system to Claim 3, wherein said data processor measures the
2 time of said zero-crossing by extrapolating between said samples.

1 5. (Original) The system of Claim 1, wherein said circuitry comprises a delay
2 element connected to one of said plural samplers, said delay element being set to an integer
3 multiple of the bit period of said data signal, said samples being used to determine the time
4 interval jitter associated with first and second zero-crossings of said signal.

1 6. (Original) A sampling apparatus capable of being used with high data rate
2 signal jitter measurement systems, comprises:

3 a first sampling circuit connected to sample a data signal and output a first
4 sample associated with a first value of said data signal;

5 a second sampling circuit connected to sample said data signal and output a
6 second sample associated with a second value of said data signal, said second value being
7 offset in time from said first value;

8 at least one sampling strobe connected to generate at least one output pulse to
9 drive said first and second sampling circuits; and

10 a delay element connected to said second sampling circuit and configured to
11 provide the offset in time between said first value and second value, said first and second
12 samples being used to measure the jitter associated with said data signal.

1 7. (Original) The apparatus of Claim 6, further comprising:

2 a splitter connected to receive said data signal and provide said data signal to
3 said first and second sampling circuits via respective first and second signal paths.

1 8. (Original) The apparatus of Claim 7, wherein said delay element is provided
2 on said second signal path associated with said second sampling circuit, said first and second
3 sampling circuits being further connected to receive said output pulse from said sampling
4 strobe substantially simultaneously and output said first and second samples, respectively,
5 substantially simultaneously.

1 9. (Original) The apparatus of Claim 6, wherein said delay element is provided
2 on a path carrying said output pulse to said second sampling circuit, said delay element being
3 configured to delay the sampling time of said data signal by said second sampling circuit as
4 compared to the sampling time of said data signal by said second sampling circuit as
5 compared to the sampling time of said data signal by said first sampling circuit.

1 10. (Original) The apparatus of Claim 6, wherein said at least one sampling strobe
2 comprises first and second sampling strobes associated with said first and second sampling
3 circuits, respectively, and further comprising:
4 a single pattern trigger circuit connected to trigger said first and second
5 sampling strobes at a time aligned with a first zero-crossing of said data signal, said delay
6 element being operatively connected between said pattern trigger circuit and said second
7 sampling circuit to delay triggering of said second sampling circuit at a time aligned with a
8 second zero-crossing of said data signal, said first and second samples being used to
9 determine the time interval jitter between said first and second zero-crossings.

1 11. (Original) The apparatus of Claim 6, wherein said delay element is set to an
2 amount less than the transition time of said data signal, said second sample being used to
3 determine the transition direction associated with a zero-crossing of said data signal in order
4 to determine the jitter associated with said zero-crossing, said zero-crossing being determined
5 from said first sample.

1 12. (Original) The apparatus of Claim 11, further comprising:
2 a third sampling circuit connected to sample said data signal and output a third
3 sample associated with a third value of said data signal;
4 a first additional delay element connected to said second sampling circuit, said
5 first additional delay element being set to an integer multiple of the bit period of said data
6 signal, said first and third samples being used to determine the time interval jitter between
7 first and second zero-crossings associated with said data signal, said first zero-crossing being
8 determined from said first sample;
9 a fourth sampling circuit connected to sample said data signal and output a
10 fourth sample associated with a fourth value of said data signal, said fourth value being offset
11 in time from said third value; and
12 a second additional delay element connected to said fourth sampling circuit,
13 said second additional delay element being set to a fraction of the transition time of said data
14 signal, said fourth sample being used to determine the transition direction associated with
15 said second zero-crossing of said data signal in order to determine the jitter associated with
16 said second zero-crossing, said second zero-crossing being determined from said third
17 sample.

1 13. (Original) The apparatus of Claim 6, wherein said delay element is set to an
2 integer multiple of the bit period of said data signal, said first and second samples being used

3 to determine the time interval jitter between two zero-crossings associated with said data
4 signal, and two zero-crossings being determined from said respective first and second
5 samples.

1 14. (Original) The apparatus of Claim 13, further comprising:
2 a third sampling circuit connected to receive a reference clock signal and
3 sample said reference clock signal to produce a first reference clock sample, said first
4 reference clock sample being used to determine the phase of said reference clock signal at the
5 time at least said first sample of said data signal is taken.

1 15. (Original) The apparatus of Claim 14, further comprising:
2 a splitter connected to receive said reference clock signal and split said
3 reference clock signal into first and second signal paths, said reference clock signal being
4 filtered to be sinusoidal, said first signal path being connected to said third sampling circuit;
5 an additional delay connected on said second signal path, said additional delay
6 being configured to delay said reference clock signal on said second signal path by around
7 ninety degrees; and
8 a fourth sampling circuit connected to receive said delayed reference clock
9 signal and sample said delayed reference clock signal to produce a second reference clock
10 sample, said first and second reference clock samples being used to determine the phase of
11 said reference clock signal at the time at least said first sample of said data signal is taken, the
12 phase being used to determine the true time that at least said first sample of said data signal is
13 taken.

1 16. (Original) The apparatus of Claim 15, wherein said splitter and additional
2 delay element are provided within a ninety degree hybrid coupler.

1 17. (Original) The apparatus of Claim 15, further comprising:
2 at least one counter connected to receive said reference clock signal and
3 configured to count the number of cycles of said reference clock signal; and
4 at least one latch connected to said counter and configured to latch the counted
5 number of cycles at the time at least said first sample is taken.

1 18. (Original) The apparatus of Claim 17, wherein said at least one counter
2 comprises first and second counters associated with said first and second sampling circuits,
3 respectively, and said at least one latch comprises first and second latches associated with
4 said first and second sampling circuits, respectively, the number of cycles latched within said
5 first and second latches being used to determine the absolute time interval between the true
6 times associated with said first and second samples of said data signal, the absolute time
7 interval being used to determine the time interval jitter associated with said two zero-
8 crossings of said data signal.

1 19. (Original) The apparatus of Claim 6, further comprising:
2 first and second analog-to-digital converters connected to receive said first and
3 second samples, respectively, and output first and second digital samples, respectively.

1 20. (Original) A sampling apparatus capable of being used with a high data rate
2 jitter measurement system, comprising:
3 a first sampling circuit connected to receive a data signal, sample said data
4 signal and output a first sample associated with a first value of said data signal;
5 a second sampling circuit connected to receive said data signal, sample said
6 data signal and output a second sample associated with a second value of said data signal,
7 said second value being offset in time from said first value;
8 at least one sampling strobe connected to provide at least one output pulse to
9 drive said first and second sampling circuits;
10 a single pattern trigger circuit connected to trigger said at least one sampling
11 strobe to generate said at least one output pulse; and
12 a delay element connected to said second sampling circuit and being set to an
13 integer multiple of the bit period of said data signal, said first and second samples being used
14 to determine the time interval jitter associated with said first and second zero-crossings of
15 said data signal.

1 21. (Original) The apparatus of Claim 20, wherein said at least one sampling
2 strobe comprises first and second sampling strobes connected to said pattern trigger circuit
3 and being associated with said first and second sampling circuits, respectively, said first and
4 second sampling strobes being connected to provide said respective output pulses to drive
5 said first and second samplings circuits, said delay element being operatively connected
6 between said pattern trigger circuit and said second sampling strobe to delay said output pulse
7 produced by said second sampling strobe.

1 22. (Original) The apparatus of Claim 21, further comprising:

2 a splitter associated with said first sampling circuit and connected to receive a
3 reference clock signal and split said reference clock signal into first and second signal paths,
4 said reference clock signal being filtered to be sinusoidal;

5 a first additional delay connected on said second signal path, said first
6 additional delay being configured to delay said reference clock signal on said second signal
7 path by around ninety degrees;

8 a third sampling circuit connected to receive said reference clock signal and
9 sample said reference clock signal to produce a first reference clock sample; and

10 a fourth sampling circuit connected to receive said delayed reference clock
11 signal and sample said delayed reference clock signal to produce a second reference clock
12 sample, said first and second reference clock samples being used to determine the phase of
13 said reference clock signal at the time at least said first sample of said data signal is taken, the
14 phase being used to determine the true time that at least said first sample of data signal is
15 taken.

1 23. (Original) The apparatus of Claim 22, further comprising:

2 an additional splitter associated with said second sampling circuit and
3 connected to receive said reference clock signal and split said reference clock signal into third
4 and fourth signal paths, said reference clock signal being filtered to be sinusoidal;

5 a second additional delay connected on said fourth signal path, aid second
6 additional delay being configured to delay said reference clock signal on said fourth signal
7 path by around ninety degrees;

8 a fifth sampling circuit connected to receive said reference clock signal on said
9 first signal path and sample said reference clock signal to produce a third reference clock
10 sample; and

11 a sixth sampling circuit connected to receive said delayed reference clock
12 signal on said fourth signal path and sample said delayed reference clock signal to produce a
13 fourth reference clock sample, said third and fourth reference clock samples being used to
14 determine the phase of said reference clock signal at the time said second sample on said data
15 signal is taken, the phase calculated using said third and fourth reference clock samples being
16 used to determine the true time that said second sample of data signal is taken.

1 24. (Original) The apparatus of Claim 24, further comprising:

2 a first counter connected to said splitter associated with said first sampling
3 circuit and configured to count the number of cycles of said reference clock signal received at
4 said first sampling circuit at the time said first sampling circuit is triggered;

5 a first latch connected to said first counter and configured to latch a first
6 counted number of cycles at the time at least said first sample is taken;

7 a second counter connected to said additional splitter associated with said
8 second sampling circuit and configured to count the number of cycles of said reference clock
9 signal received at said second sampling circuit at the time said second sampling circuit is
10 triggered; and

11 a second latch connected to said second counter and configured to latch a
12 second counted number of cycles at the time at least said second sample is taken, said first
13 and second counted number of cycles being used to determine the absolute time interval
14 between the true times associated with said first and second samples of said data signal, the
15 absolute time interval being used to determine the time interval jitter associated with said first
16 and second zero-crossings of said data signal.

1 25. (Original) A method for determining the jitter associated with high data rate
2 data signal, comprising:
3 generating at least one output pulse to drive first and second sampling circuits;
4 providing a delay element connected to said second sampling circuit;
5 sampling said data signal by said first sampling circuit to produce a first
6 sample associated with a first value of said data signal; and
7 sampling said data signal by said second sampling circuit to produce a second
8 sample associated with a second value of said data signal, said second value being offset in
9 time from said first value, said first and second samples being used to measure the jitter
10 associated with said data signal.

1 26. (Original) The method of Claim 25, further comprising:
2 splitting said data signal onto first and second signal paths, said first signal
3 path connected to said first sampling circuit and said second signal path being connected to
4 said second sampling circuit.

1 27. (Original) The method of Claim 26, wherein said step of providing further
2 comprises:
3 providing said delay element on said second signal path associated with said
4 second sampling circuit, said first and second sampling circuits being further connected to
5 receive said output pulse substantially simultaneously and produce said first and second
6 samples, respectively, substantially simultaneously.

1 28. (Original) The method of Claim 25, wherein said step of providing further
2 comprises:
3 providing said delay element on a path carrying said output pulse to said
4 second sampling circuit, said delay element being configured to delay the sampling time of
5 said data signal by said second sampling circuit as compared to the sampling time of said data
6 signal by said first sampling circuit.

1 29. (Original) The method of Claim 25, wherein said step of generating further
2 comprises:
3 generating first and second output pulses associated with said first and second
4 sampling circuits, respectively, and further comprising the step of:
5 providing a single trigger to generate said first and second output pulses, said
6 delay element delaying triggering of said second output pulse.

1 30. (Original) The method of Claim 25, wherein said step of providing further
2 comprises:
3 setting said delay element to an amount less than the transition time of said
4 data signal, said second sample being used to determine the transition direction associated
5 with a zero-crossing of said data signal in order to determine the jitter associated with said
6 zero-crossing, said zero-crossing being determined from said first sample.

1 31. (Original) The method of Claim 25, wherein said step of providing further

2 comprises:

3 setting said delay element to an integer multiple of the bit period of said data
4 signal, said first and second samples being used to determine the time interval jitter between
5 two zero-crossings associated with said data signal, and two-zero-crossings being determined
6 from said respective first and second samples.

1 32. (Original) The method of Claim 31, further comprising:

2 sampling a reference clock signal to produce a first reference clock sample,
3 said first reference clock sample being used to determine the phase of said reference clock
4 signal at the time at least said first sample of said data signal is taken.

1 33. (Original) The method of Claim 32, further comprising:

2 splitting said reference clock signal into first and second signal paths, said
3 reference clock signal being filtered to be sinusoidal, said first reference clock signal being
4 associated with said first signal path;

5 providing an additional delay connected on said second signal path, said
6 additional delay being configured to delay said reference clock signal on said second signal
7 path by around ninety degrees.

8 sampling said delayed reference clock signal on said second signal path to
9 produce a second reference clock sample; said first and second reference clock samples
10 being used to determine the phase of said reference clock signal at the time at least said first
11 sample of said data signal is taken, the phase being used to determine the true time that at
12 least said first sample of data signal is taken.

1 34. (Original) The method of Claim 33, further comprising:
2 counting the number of cycles of said reference clock signal; and
3 latching the counted number of cycles at the time at least said first sample is
4 taken.

1 35. (Original) The method of Claim 34, wherein said step of counting comprises:
2 counting a first number of cycles of said reference clock signal associated with
3 said first sampling circuit; and
4 counting a second number of cycles of said reference clock signal associated
5 with said second sampling circuit, and wherein said step of latching further comprises:
6 latching a first counted number of cycles at the time said first sample is taken;
7 and
8 latching a second counted number of cycles at the time said second sample is
9 taken, said first and second counted number of cycles being used to determine the absolute
10 time interval between the true times associated with said first and second samples of said data
11 signal, the absolute time interval being used to determine the time interval jitter associated
12 with two zero-crossings of said data signal.
